

Exercise 1:

Consider an object M that is moving on a horizontal straight trajectory. The position of M is located on the axis $\overrightarrow{x'x}$ taken along this trajectory.

At the instant $t_1 = 2s$, the object was at point M_1 , then at the instant $t_2 = 6s$, the object becomes at M_2 as shown by the figure of doc.1.

- 1- What is the position of the mobile at the instants t_1 and t_2 .
- 2- Plot the displacement vector between M_1 and M_2 .
- 3- Calculate the value of the average speed between t_1 and t_2 .

Doc. 1

Exercise 2:

The figure below reproduces, to real scale, the successive positions, separated by the same interval of time $\tau = 50ms$, of a mobile A on a horizontal table.

1. What is the shape of the trajectory?
2. Calculate the average speed of A between t_1 and t_6 .
3. Calculate the instantaneous speed of A at t_1 , t_3 , t_4 and t_6 .
